1.1 SIGNAX Mission

Today, many developers have learned how to apply BIM in design and have chosen Autodesk products as their basis. Expanding Autodesk's capabilities, we have developed services for applying BIM on the construction site. Meet SIGNAX. Our extensions, built on the versatile Autodesk Forge platform, enhance your work with features like comments, scope control, QR codes, and local server backups. Best of all, you can monitor construction progress and access these tools from your smartphone, tablet, or PC. We have developed a service for capturing and using Photo360 on the construction site and the Customer's Account on your smartphone to make it available anywhere. Your device displays all the relevant information during the project's implementation and allows you to make truly rational management decisions.
